suggests avoiding the use of hot-climate clothing.

"Fabric softeners leave a residue on the fabric that reduces the ability to absorb and transport the moisture," Pascoe

In addition, literature does not support the notion that wearing light colored clothing will keep you cooler than dark colored clothing. Although dark colors absorb more heat and result in a higher surface temperature, a warmer fabric surface can actually reduce the transfer of heat through clothing.

drated during the extreme heat. "As little as 2-percent dehydration can influence motor skills and performance," Pascoe said. "Individuals who are dehydrated are also more prone to temperature increases and heatrelated problems."

Humans, though, are very poorly designed to handle "We have already become

dehydrated once we feel thirsty," Pascoe said. And although water is an excellent way to hydrate oneself, Pascoe does not discriminate among which fluid is most ef-

"Water, sports drinks, and even caffeinated beverages are all effective ways to stay hydrated," according to Pascoe. "The key is to make sure you are consuming fluids."

One way to stay hydrated is by matching fluids lost through sweat to one's fluid intake, according to Pascoe. "It is important to realize what kind of sweater you are,"

Annual Drinking Water Quality Report Jack Water System, Inc.

January-December 2007

Is my water safe?

Last year, as in years past, your tap water met all U. S. Environmental Protection Agency (USEPA) and the Alabama Department of Environmental Management (ADEM) drinking water health standards. Your local water officials vigilantly safeguard its water supplies and once again we are proud to report that our system has not violated a maximum contaminant level or any other water quality standards. We're pleased to present to you this year's Annual Drinking Water Quality Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water. Our water sources are three groundwater wells. The water we supply comes from the Clayton Aquifer. The Jack Water System also purchases water from the Pike County Water Authority. The Pike County Water Authority utilizes groundwater taken from the Ripley Aquifer and the Tuscaloosa Aquifer. The water we provide to our customers requires no specialized treatment. However, chlorine is added to the water for disinfection purposes. This insures the quality of water throughout our distribution system.

The Jack Water System routinely completes a water storage facility inspection plan, and utilizes a Bacteriological Monitoring Plan and a Cross Connection Policy is in place to insure good safe drinking water for our customers We have completed a Source Water Assessment Plan which is available at our office for review. This report provides information about potential sources of contamination and is

We want our valued customers to be informed about their water utility. If you want to learn more, please attend any one of our regularly scheduled Board meetings. They are held on first Monday of each month at the Zion Chapel School located at Highway 87 North, in Jack, and begin at 7:00 p.m.

The members of the Board of Directors are:

Wiley Vann, President Phil Rugg, Vice President Roxie Smart, Secretary Kieff Lambert Jimmy Ray Ward

IMPORTANT DRINKING WATER DEFINITIONS:

ACCTION LEVEL (AL) - The concentration of a contaminant that triggers treatment or other requirements that a water system shall follow.

Maximum Contaminant Level - (MCL) The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology. Maximum Contaminant Level Goal "(MCLG) - The level of a contaminant in drinking water below, which there is no known or expected risk to health. MCLGs allow for a margin of safety. Maximum Residual Disinfectant Level (MRDL) - The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of mi-

Maximum Residual Disinfectant Level Goal (MRDLG) - The level of a drinking water disinfectant below which there is no know or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Millirems per year (mrem/yr) - measure of radiation absorbed by the body.

Nephelometric Turbidity Unit (NTU) - Nephelometric turbidity unit is a measure of the clarity of water. Turbidity in excess of 5 NTU is just noticeable to the average person.

Non-Detects (ND) - Laboratory analysis indicates that the constituent is not present. Parts per million (ppm) or Milligrams per liter (mg/L) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter (mg/L) - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

Parts per trillion (ppt) or Nanograms per liter (ng/L) - one part per trillion corresponds to one minute in 2,000,000 years, or a single penny in \$10,000,000,000.

Parts per quadrillion (ppq) or Picograms per liter (pg/L) - one part per quadrillion corresponds to one minute in 2,000,000,000 years or one penny in \$10,000,000,000.

Picocuries per liter (pCi/L) - picocuries per liter is a measure of the radioactivity in water.

Treatment Technique (TT) - A required process intended to reduce the level of a contaminant in drinking water. Threshold Odor Number (T.O.N.) - The greatest dilution of a sample with odor-free water that still yields a just-detectable odor.

Variances & Exemptions - ADEM or EPA permission not to meet an MCL or a treatment technique under certain conditions.

Explanation of reasons for variance/exemptions

Unregulated contaminants are those for which EPA has not established drinking water standards. The purpose of unregulated contaminant monitoring is to assist EPA in determinign the occurrence of unregulated contaminants in drinking water and whether future regtulation is warranted.

TABLE OF UNREGULATED DRINKING WATER CONTAMINANTS

TABLE OF SECONDARY DRINKING WATER CONTAMINANTS

MCL UNIT MEASUREMEN

CONTAMINANT

CONTAMINANT

Based on a study conducted by ADEM with the approval of the EPA a statewide waiver for the monitoring of asbestos and dioxin was issued. Thus monitoring for these contaminants was not required. The Jack Water System and the Pike County Water Authority routinely monitor for contaminants in your drinking water according to Federal and State laws. Unless otherwise noted, the data presented in the ollowing tables show the results of our monitoring period of January 1st to December 31st, 2007.

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over surface of the land or through the ground, it dissolves naturally occurring minerals and radioactive material, and it can pick up substances resulting from the presence of animals or from human activities.

As you can see by the tables, our system had no monitoring violations of allowable limits of contaminants in drinking water. We're proud that your drinking water meets or exceeds all Federal and State requirements. We have learned through our monitoring and testing that some contaminants have been detected. The EPA has determined that your water IS SAFE at these levels. MCL's are set at very stringent levels. To understand the possible health effocts described for many regulated contaminants, a person would have to drink 2 liters of water every day at the MCL level for a lifetime to hae a one-in-a-million chance of having the described health effect.

Total Coliform: The Total Coliform Rule requires water systems to meet a stricter limit for coliform bacteria. Coliform bacteria are usually harmless, but their presence in water can be an indication of disease-causing bacteria. When coliform bacteria are found, special follow-up tests are done to determine if harmful bacteria are present in the water supply. If this limit is exceeded, the water supplier must notify the public by newspaper, television or radio. To comply with the stricter regulation, we have increased the average amount of chlorine in the distribution system.

Lead in Drinking Water: "If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Jack Water System is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure in available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead."

Some people may be more vulnerable to contaminants in drinking water than the general population. People who are immuno-compromised such as cancer patients undergoing chemotherapy, organ transplant recipients, HIV/AIDS positive or other immune system disorders, some elderly, and infants can be particularly at risk from infections. People at risk should seek advice about drinking water from their health care providers. EPA (Environmental Protection Agency)/CDC (Center of Disease Control) Guidelines on appropriate means to lessen the risk of infection by Crytosporidium and other micropiological contaminants are available from the Safe Drinking Water Hotline. All Drinking water, including bottled drinking water, may reasonably be expected to contain at least small amounts of some contaminants. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (800-426-4791).

In our continuing efforts to maintain a safe and dependable water supply it may be necessary to make improvements in your water system. The costs of these improvements may be reflected in the rate

All drinking water, including bottled drinking water, may be reasonably expected to contain at least small may be necessary in order not necessarily pose a health risk. The EPA or ADEM requires us to monitor for certain contaminants less than once per ver because the concentrations of these contaminants less than mants. once per yer because the concentrations of these contaminants do not change frequently.

The table below lists all of the drinking water contaminants that we detected. Thank you for allowing us to
